## Flood protection kitchen with check valve

Drain  
with check  
valve.

- **Drains water leakage to wastewater pipe.**
- **Quick, easy and maintenance-free installation.**

Flood protection is the easiest way to divert leaking water to a wastewater pipe without installing a floor drain.

The installation is simple and quick and requires minimal maintenance. The flood protection is mounted in drain pipes with a diameter of 75 mm. The check valve prevents unpleasant odours from seeping out of the drain.

**Installation:** The prerequisite for installing the flood protection in the kitchen is that a drain manifold comes up out of the floor. Therefore, it is important to plan the drain manifold in the kitchen floor (under the sink cabinet) when building a new house. Connection to the manifold is done from the sink and to the flood protection.
