

# Tollco Wet Zone Kitchen

## System description

- **Install when a new kitchen is assembled.**
- **Fits all kitchens.**

**Creates  
waterproof  
wet zone.**

Good planning is the key to avoiding water damage. Because we know that all kitchens are unique, we have developed floor protection and flood protection that can be customised and combined based on the existing conditions.

By installing a complete water damage prevention system when assembling the kitchen, you avoid unpleasant and costly surprises in the future. You can choose whether the system will be open, which means that water leakage can flow onto the kitchen floor where it becomes visible. You can also choose for the system to be closed, which means that water leakage is collected on the floor protection and not diverted out to the kitchen floor. In this case, the flood protection is installed with either a water circuit breaker or flood protection with a water alarm.

The kitchen is the most vulnerable place when it comes to water damage. With the products included in our system, you can easily prevent it from occurring.

### **Tollco floor protection for dishwashers and washing machines as well as sink cabinets**

Dishwashers and washing machines are typical hazards that can cause water damage. To avoid

water damage in the kitchen, place dishwashers, washing machines and sink cabinets on the floor protectors. This helps prevent water damage from occurring on these hidden surfaces. We offer two different floor protectors that can be mounted side by side using an edge clamp.

One protector is a closed trough that collects water under the sink cabinet. The other is a combined dishwasher, washing machine and floor protector with an outlet where the water can be diverted and become visible. This means that the leak is immediately visible.
